

Plasma vs LCD screens

Technical Differences:

<http://www.lcdtvbuyingguide.com/lcdtv-plasmavslcd.shtml>

Usage Comparisons:

<http://www.cnet.com.au/plasma-vs-lcd-six-things-you-need-to-know-339273215.htm?omnRef=NULL>

	Plasma	LCD
Pros	More natural colour reproduction Better black levels and contrast Fast motion Lower price for large screens	Wider choice of screen sizes Sharper image with smaller pixel sizes Uses less energy Thinner and lighter
Cons	Uses more power Large and heavier More glare Less economical to produce in smaller sizes	More expensive in large sizes Limited colour palette Light leakage Difficult to produce true blacks Pixelation in fast-action scenes

Which is best?

As with the DLP vs LCD debate with projectors, the answer is simple - neither one is better than the other. They both have advantages over the other, and they both have limitations. And the choice gets down to what you want this equipment to do for you and what you like looking at.

Example: A client rang in desperation a while ago who asked this exact question. He had read many articles, had gone to several retail outlets and been told a lot of technical information. My answer to his question was simple – which did he like looking at? - this was the one important thing he had not been asked or considered !! I also advised him to consider what backup and service the supplier offered.

And now LED: Currently I have had no hands-on contact with this technology.
